

About this course

At Anthropic, we believe that empowering people with AI, and ensuring that AI makes safe contributions to society, requires engaging with a wide range of human perspectives and experiences. Responsible AI development and engagement isn't something any single discipline or viewpoint can fully address. It demands collaborative approaches that span a wide range of technical, creative, business, scientific, and educational domains. That's why we partnered with educators who bring complementary expertise to create this course on AI collaboration for educators.

In an era where AI transforms how we work, learn, and create, our students need more than technical skills—they need AI fluency. This course empowers faculty, instructional designers, and educational leaders to teach the foundational concepts presented in our AI Fluency: Framework & Foundations course in an instructor-led setting.

Participants will learn teaching approaches for sharing the 4D Framework with students, assessment and assignment strategies for measuring AI Fluency, as well as considerations for how AI shows up in discipline specific curriculum topics.

This course is the result of a long partnership between Anthropic and professors Rick Dakan from Ringling College of Art and Design and Joseph Feller from University College Cork. It builds on their experiences in training fellow educators and teaching the AI Fluency Framework to their students, and on feedback and questions that arose from our earlier course: AI Fluency: Framework & Foundations. This course addresses the questions: how can I bring the AI Fluency framework to my students, and how can I integrate AI Fluency in my discipline?

The work was supported in part by the Higher Education Authority (Ireland) through the National Forum for the Enhancement of Teaching and Learning.

Recommended prerequisites

This course lightly reviews the foundational concepts from the AI Fluency Framework. However, for deeper understanding, participants should complete AI Fluency: Framework & Foundations before beginning this curriculum.

It is also recommended that learners have active teaching or curriculum development responsibilities as well as access to an AI chat tool for hands-on practice. Examples in this course will use [Claude.ai](https://claude.ai), but any chatbot will work.
